

### **Fire - Cold Line**

You should imagine of having five companies at your disposal, each of them specialised in the exclusive production of suppression filters, connectors, fans, line cords and assemblies. And if these companies formed an only enterprise, with a single reference person, managerial costs reduced by one fifth and the possibility of evaluating no more single products but a unique system? This is Comestero Sistemi, a really skilled professional team whose target is to supply not a single product but a complete kit. Taking advantage of the gained experience, we have created two dedicated production lines: Fireline and Coldline.

#### **Fireline**

It includes a series of components studied and manufactured for high and very critical temperatures, they are successfully used in various fields such as telecommunications, electrical equipment for aesthetics, illuminating engineering, chimneys and pellet stoves. In particular: F class fans, IEC 320 connectors up to T120°C, line cords of PVC, rubber and neoprene rubber, T125°C switches, wiring and connections made of materials for high temperatures.

#### **Coldline**

The line of products expressly dedicated to the refrigeration sector. Components studied to obtain the highest performances even at rigorous temperatures, as for instance the fans in AC, which maintain high performances and long life in environments with temperatures reaching -40°C. The solutions for this line include: fans in AC up to -40°C, available also in the IP 55 version, boxed, plugged and cylindrical filters, structural wiring for refrigeration appliances.
